

IASI L0 and L1 Weekly Monitoring Report

IASI monitoring team

19/04/2010 00:00:00 - 26/04/2010 00:00:00 (Week 16)

1 Introduction

This report provides summary monitoring plots and figures from IASI instrument on the MetOp-A satellite retrieved from the IASI L0 and L1 ENG product (3 minute data packet) for 19/04/2010 00:00:00 - 26/04/2010 00:00:00 .

The monitoring data are extracted on PDU basis.

Data extraction, calibration, processing and statictics are performed at EUMETSAT.

5 Radiance monitoring based on NWP

The radiance monitoring compares the IASI measurements (L1C-eps-products) obtained under clear sky situation over sea with modeled radiances. Cloud identification is based on cloud flag of co-located AVHRR L1B data in addition to information from the IASI L1C clustering analysis here only homogenous situations are taken into account (99.0 percent in first class). The RTIASI radiative transfer model is feed with co-located ECMWF profiles of T,WV, and Ozon. Information about the SST is obtained from the AVHRR L1B or taken from AVHRR scenes analysis (CGS only).

6 IASI-HIRS radiance comparision Channel 1-19

The radiance comparision of IASI and HIRS/4 on-board MetOp is performed on all pixel with distances smaller than 3 km between IASI and HIRS. The radiance differences IASI - HIRS are given in brightness temperatures at 280K reference temperature.
